

## Automilkers in Rotary Installation With Remote Take Off

1. The RTO (remote take off) can determine if the Automilker is still milking at the point when the infra-red beam aligns with the Automilker, just before the exit on the platform and turns the Automilker off.
2. The red LED will show that the Automilker is in milking mode i.e. "VAC ON".
3. When the RTO turns the Automilker off, the remote display will flash on & off the number of lights that were on at the time of take off.
4. If this occurs often then it can indicate that the platform is rotating too fast and should be slowed.
